

TECHNICAL SHEET

Description	Dimensions	Weight	Code
RNW 508	826x287x635 mm	47 kg	7040050

Ductable isothermal dehumidifier with summer and winter integration for horizontal ceiling installation. It consists in a complete cooling unit (with refrigerant R134a), centrifugal fan and pre and post-treatment coils to be supplied separately with cooled water (15 °C).
Siphon on condensate drain mandatory.

Package content

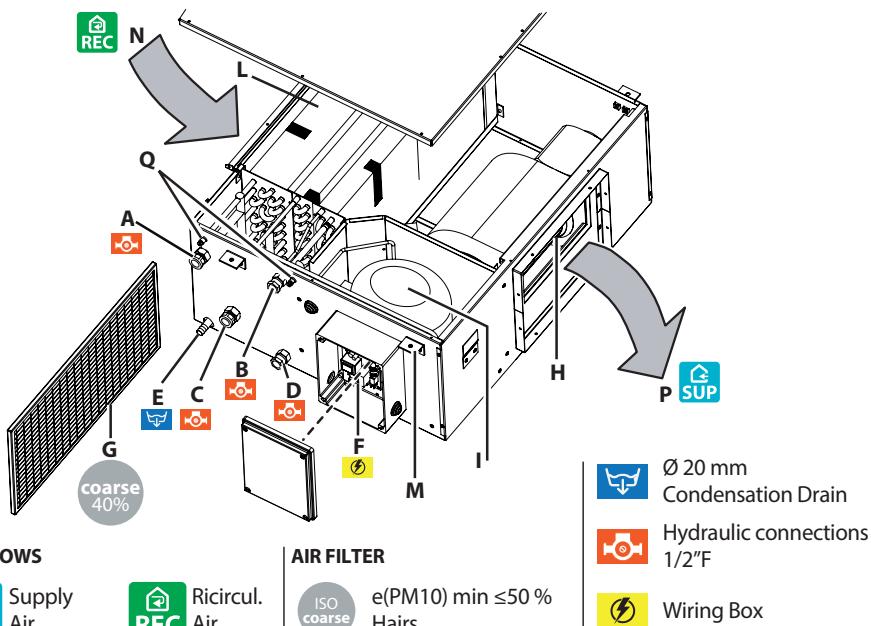

- RNW 508
- Installation / Technical Manual

- Max. electrical power: 515 W
- Power supply 230 Vac - 50 Hz
- Pre-treatment coils water temp. 15 °C 360 l/h
- Post-treatment coil water temp. 15 °C 170 l/h
- Nominal air flow rate 500 m³/h
- Refrigerant: R134a (300 g)

Component description

- **Compressor:** hermetically sealed with a bipolar single-phase asynchronous motor coupled with an alternative single cylinder compressor.
- **Condenser temperature probe:** NTC sensor which measures the temperature of the air after the condenser
- **Water temperature probe:** NTC sensor which measures the temperature of the water
- **Evaporator temperature probe:** NTC sensor which measures the temperature of the air after the condenser
- **Circuit board fuse:** 250V- 8 A

COMPONENTS

Rif.	Description
A	Water exit pre-treatment (1/2" F)
B	Water exit post-treatment (1/2" F)
C	Water inlet pre-treatment (1/2" F)
D	Water inlet post-treatment (1/2" F)
E	Discharge Ø 20 mm for condensation
F	Electrical panel
G	Filter
H	Fan
I	Compressor
L	Exchanger
M	Fixing brackets
N	Air inlet
P	Exit dehumidified air
Q	Vent

Depth	830 mm

ACOUSTIC CHARACTERISTICS

The presence of canalisation and/or plenums further reduces the sound pressure level measured. The sound pressure levels of the equipment were measured in a reverberation chamber with the dehumidifier fully open without plenum. The measurements, shown in table, were taken at the three different fan speeds with the equipment operating in dehumidification mode only.

Frequency of central band [Hz]	Values measured in the outside reverberation chamber					
	LEVEL OF SOUND PRESSURE			LEVEL OF SOUND POWER		
	Speed 1 (dB)	Speed 2 (dB)	Speed 3 (dB)	Speed 1 (dB)	Speed 2 (dB)	Speed 3 (dB)

TECHNICAL SHEET

PERFORMANCE

Total refrigerating power (reserved to dehumidifier pre-treatment and post-treatment batteries) to the dehumidification yield, depending on the ambient temperature, relative humidity and temperature of the chilled water.

The data reported in table refer to equipment dehumidification conditions of operation with emission of neutral air or of sensible heat levels. Feeding in parallel the pre-treatment and posttreatment coils with a flow rate of 6 l/min and 2,8 l/min, there is a comprehensive pressure loss of about 1 m, the different geometrical characteristics of the coils automatically divide water flow. In the case of emission made with sensible heat levels, the comprehensive maximum water flow to the coils is a total of 8,8 liters/minute. Dividing the water flow to the post-treatment coil, with a calibrating valve, it is possible to reduce or annul the significant contribution of refrigerating power while maintaining a high level of dehumidification.

Power and cooling performance in dehumidification

60	4,32	4,84	5,4	3,58	0,74	4,16	0,68	4,80	0,60	

CHARACTERISTIC CURVES

The diagram shows the curves of the prevalence available to the ventilator of the apparatus. The ductwork of the dehumidifier must be sized according to this parameter. The pressure available is expressed as a value of the air flow (nominal flow of 500 m³/h) and in the three possible speed settings. The fan medium speed setting is made at the factory (MED).

PRESSURE LOSS OF THE HYDRAULIC CIRCUIT

The two curves represented in the diagram below indicate the pressure drop on the battery to the water of pre-treatment and post-treatment of the air in the dehumidifier. The dehumidifier is fitted with separate external attacks for pre-treatment and post-treatment coils. It is possible, therefore, to feed the batteries separately with two independent lines of adduction or connected in parallel near the dehumidifier. The particular geometric configuration automatically shares the flow on the two batteries at a rate of 2/3 on that of the pre-treatment and 1/3 on that of post-treatment whenever the feed is in parallel on the two coils.
